Internet Users by Country

Internet Users by Country (2016)

See also: [2015 Estimate](#) and [2014 Finalized](#)

#	Country	Internet Users (2016)	Penetration (% of Pop)	Population (2016)	Non-Users (internetless)	Users 1 Year Change (%)	Internet Users 1 Year Change	Population 1 Y Change
1	China	721,434,547	52.2 %	1,382,323,332	660,888,785	2.2 %	15,520,515	0.46 %
2	India	462,124,989	34.8 %	1,326,801,576	864,676,587	30.5 %	108,010,242	1.2 %
3	U.S.	286,942,362	88.5 %	324,118,787	37,176,425	1.1 %	3,229,955	0.73 %
4	Brazil	139,111,185	66.4 %	209,567,920	70,456,735	5.1 %	6,753,879	0.83 %
5	Japan	115,111,595	91.1 %	126,323,715	11,212,120	0.1 %	117,385	-0.2 %
6	Russia	102,258,256	71.3 %	143,439,832	41,181,576	0.3 %	330,067	-0.01 %
7	Nigeria	86,219,965	46.1 %	186,987,563	100,767,598	5 %	4,124,967	2.63 %
8	Germany	71,016,605	88 %	80,682,351	9,665,746	0.6 %	447,557	-0.01 %
9	U.K.	60,273,385	92.6 %	65,111,143	4,837,758	0.9 %	555,411	0.61 %
10	Mexico	58,016,997	45.1 %	128,632,004	70,615,007	2.1 %	1,182,988	1.27 %
11	France	55,860,330	86.4 %	64,668,129	8,807,799	1.4 %	758,852	0.42 %
12	Indonesia	53,236,719	20.4 %	260,581,100	207,344,381	6.5 %	3,232,544	1.17 %
13	Viet Nam	49,063,762	52 %	94,444,200	45,380,438	3.3 %	1,564,346	1.07 %
14	Turkey	46,196,720	58 %	79,622,062	33,425,342	5.1 %	2,242,750	1.22 %
15	Philippines	44,478,808	43.5 %	102,250,133	57,771,325	4.4 %	1,855,574	1.54 %

Data Growth

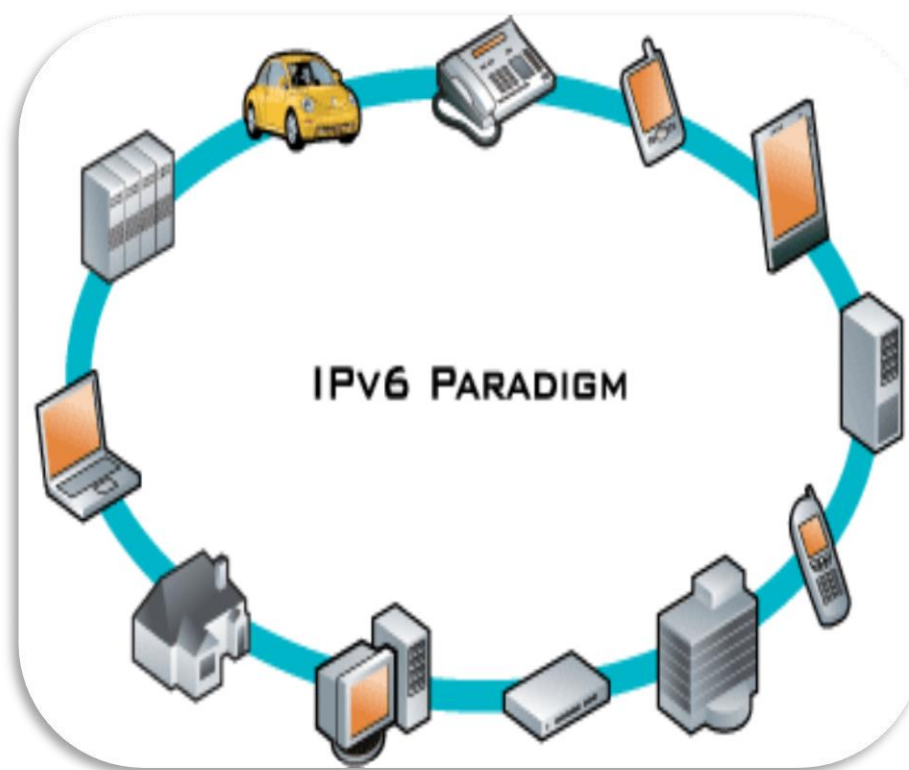

The Internet of Things

IPv4

IPv6

Data Networking Role, Components, and Challenges

Various elements make up a network :

- **Devices:** These are used to communicate with one another
- **Medium:** This is how the devices are connected together
- **Messages:** Information that travels over the medium
- **Rules:** Governs how messages flow across network

Network Architecture - Reliable Networks

Empat karakteristik dasar yang harus dipenuhi agar suatu infrastruktur jaringan bisa dikatakan baik (memenuhi kebutuhan pengguna):

- ***Fault Tolerance***
 - ***Scalability***
 - ***Quality of Service (QoS)***
 - ***Security***
- 

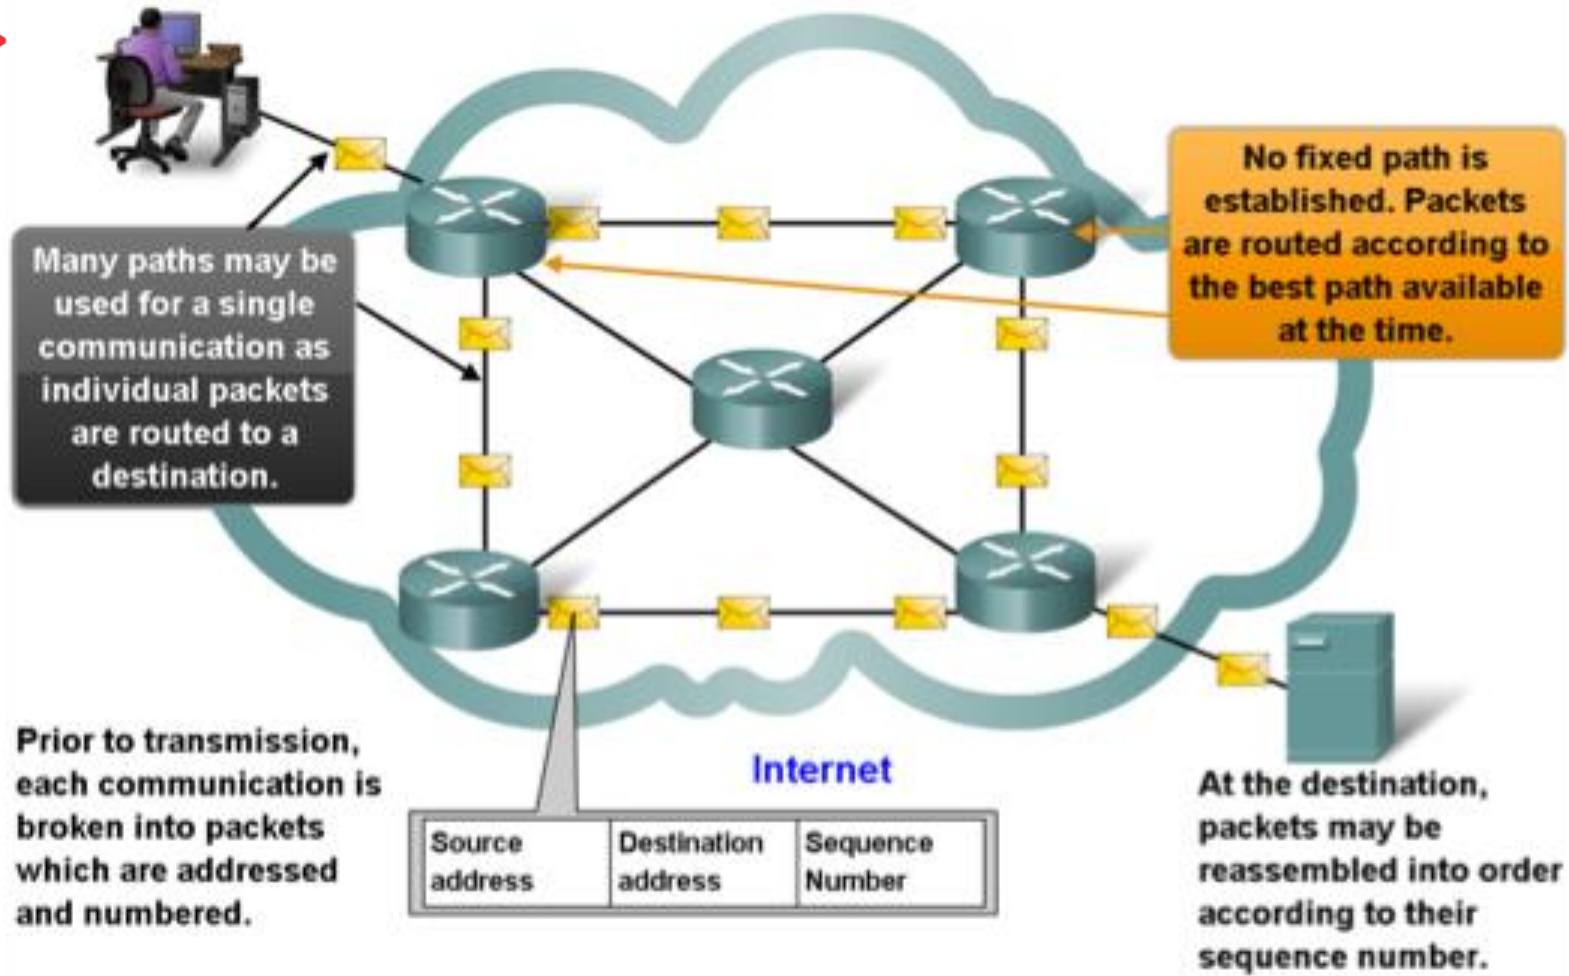

Fault Tolerance (Toleransi Kesalahan)

Sebuah jaringan 'fault tolerant' merupakan salah satu metode yang digunakan untuk mengurangi dampak kerusakan hardware atau software dan dapat pulih dengan cepat ketika terjadi masalah.

Packet switching dapat meningkatkan ketahanan dan fault tolerance dari arsitektur internet.

Packet Switching in a Data Network

Scalability

Jaringan bersifat *scalable*, artinya mampu beradaptasi dengan cepat untuk mendukung pengguna baru tanpa mengganggu atau mempengaruhi kinerja jaringan dan layanan yang lama.

Karakteristik internet yang dapat membantu memenuhi user demand:

- Hierarchical
 - Common standards
 - Common protocols
- 

Examples are Verizon, Sprint, AT&T, NTT, cable systems, and wide area wireless networks.

This is the backbone of the Internet.

At the center of the Internet, Tier-1 ISPs provide national and international connections. These ISPs treat each other as equals.

The point where ISPs interconnect is often called a border.

Tier-2 ISPs are smaller and often provide regional service. Tier-2 ISPs usually pay Tier-1 ISPs for connectivity to rest of the Internet.

Peer connections between networks at the same level provide direct connections, bypassing longer routes and preventing congestion on the backbone.

Tier-3 ISPs are the local providers of service directly to end users. Tier-3 ISPs are usually connected to Tier 2 ISPs and pay Tier 2 providers for Internet access.

Quality of Services (QoS)

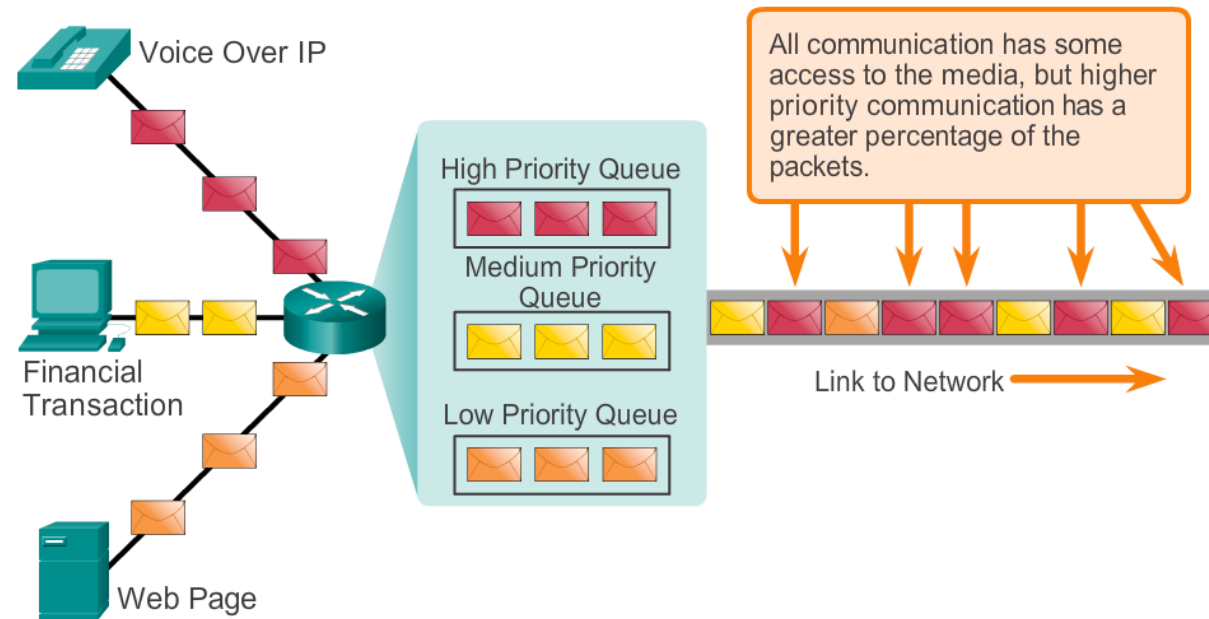

Jaringan membutuhkan mekanisme untuk mengatur lalu lintas jaringan yang macet.

Bandwidth jaringan adalah ukuran kapasitas jaringan. Dengan kata lain, berapa banyak informasi yang dapat dikirim dalam jumlah waktu tertentu? Bandwidth jaringan diukur dalam jumlah bit yang dapat ditransmisikan dalam satu detik, atau bit per detik (bps).

Ketika komunikasi simultan dicoba di seluruh jaringan, permintaan bandwidth jaringan dapat melebihi ketersediaannya, menciptakan kemacetan jaringan (network congestion).

Using Queues to Prioritize Communication

Queuing according to data type enables voice data to have priority over transaction data, which has priority over web data.

Security

- ▶ Ada dua tipe keamanan jaringan:
network infrastructure security dan **information security**

Tindakan dasar pengamanan jaringan

Memastikan **confidentiality** (kerahasiaan) dengan penggunaan

- Autentikasi user
- Enkripsi data

Mempertahankan **integrity** dengan penggunaan

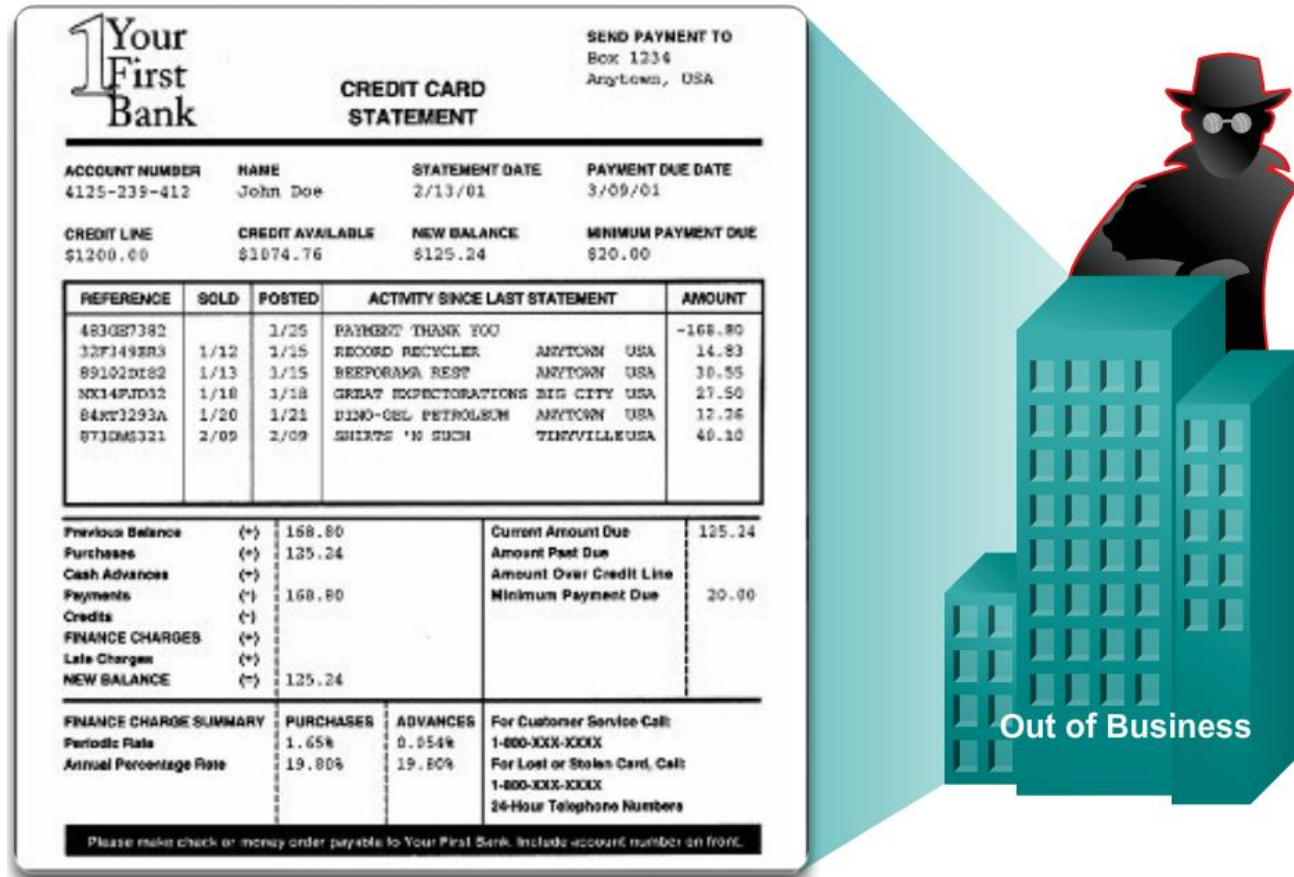

- Digital signatures

Memastikan **availability** (ketersediaan) dengan penggunaan

- Firewalls
- Redundant network architecture
- Network and hardware without a single point of failure

Security is Important for How We Use a Network

Out of Business

Unauthorized use of our communications data can have severe consequences.

Jaringan Komunikasi dan Data

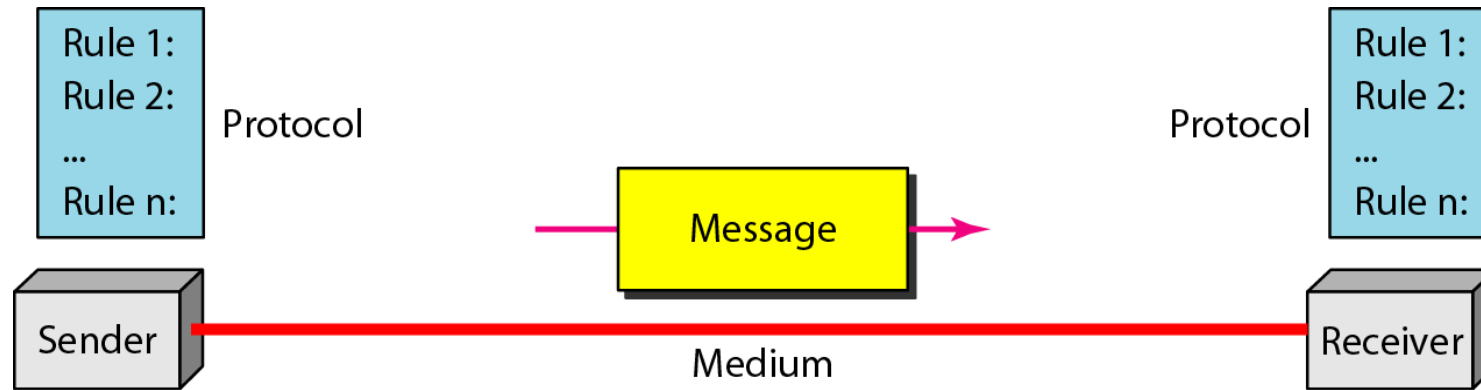

Komunikasi Data

Istilah **telekomunikasi** berarti komunikasi pada jarak jauh. **Data** mengacu pada informasi yang disajikan dalam bentuk apapun yang disepakati oleh pembuat dan pengguna data.

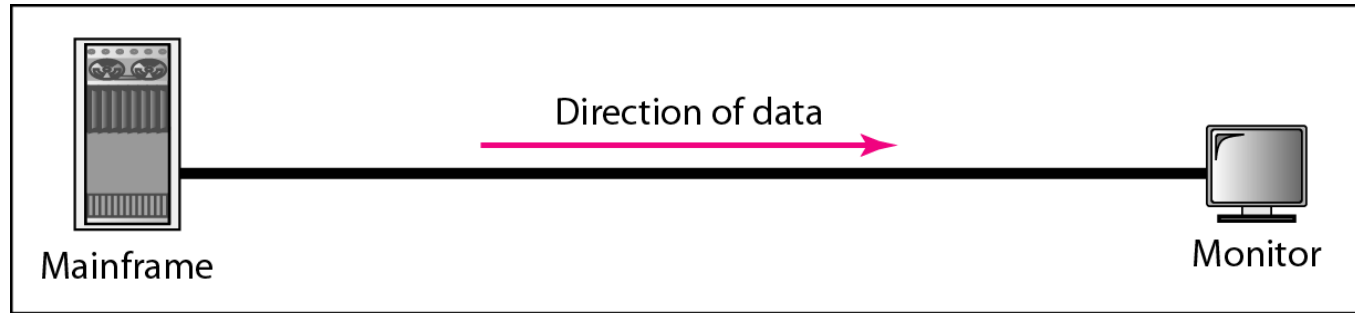

Komunikasi data adalah pertukaran data antara dua perangkat melalui berbagai bentuk media transmisi, misalnya wire cable.

Sistem Komunikasi Data

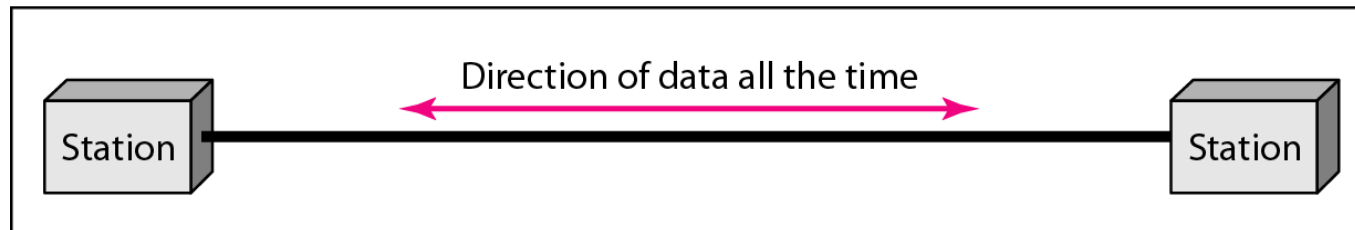

Data flow (simplex, half-duplex, and full-duplex)

a. Simplex

b. Half-duplex

c. Full-duplex

Jaringan

Jaringan adalah seperangkat alat (node) yang terhubung oleh link komunikasi. Node dapat berupa komputer, printer, atau perangkat lain yang mampu mengirim dan/atau menerima data yang dihasilkan oleh node lain di jaringan. Link dapat berupa kabel, udara, serat optik, atau media apa pun yang dapat mengangkut informasi pembawa sinyal.

Network Criteria

Performance

Depends on Network Elements

Measured in terms of Delay and Throughput

Reliability

Failure rate of network components

Measured in terms of availability/robustness

Security

Data protection against corruption/loss of data due to:

Errors

Malicious users

Physical Structures

Type of Connection

Point to Point - single transmitter and receiver

Multipoint - multiple recipients of single transmission

Physical Topology

Connection of devices

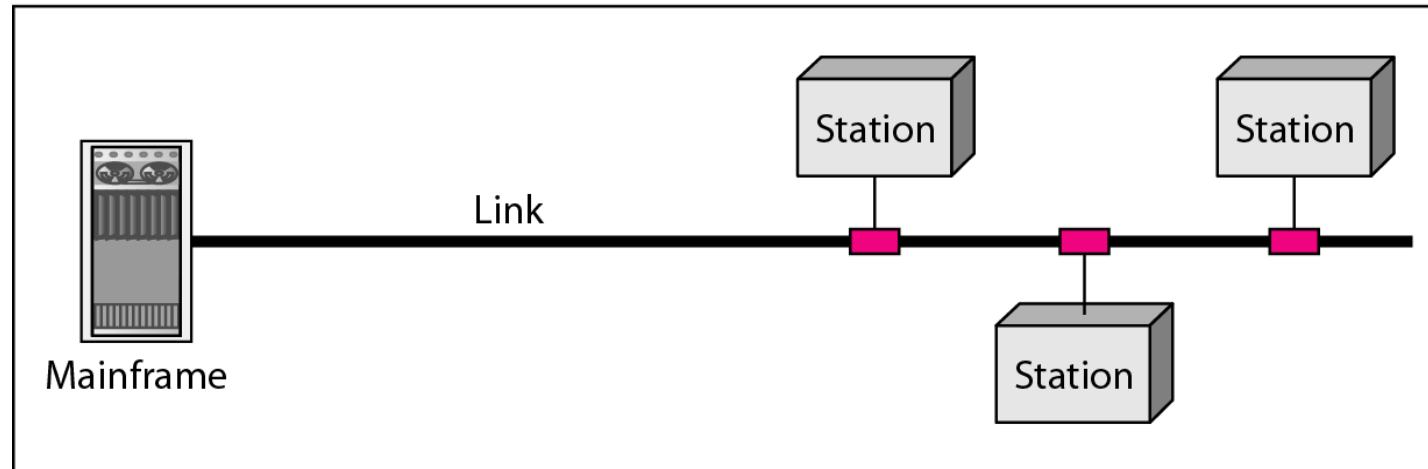

Type of transmission - unicast, multicast, broadcast

Types of connections: point-to-point and multipoint

a. Point-to-point

b. Multipoint

Categories of topology

A fully connected **mesh** topology (five devices)

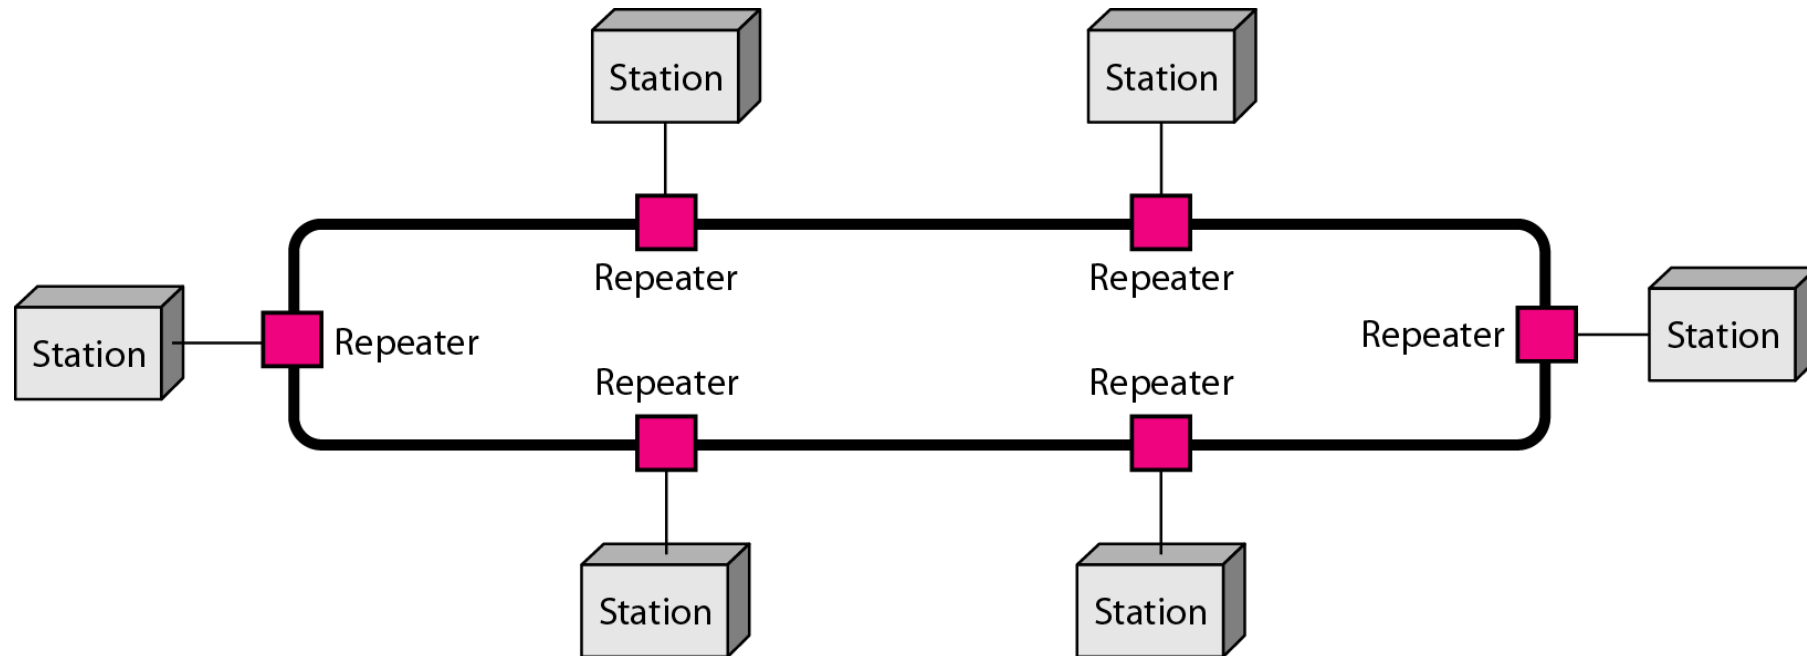

A **star** topology connecting four stations

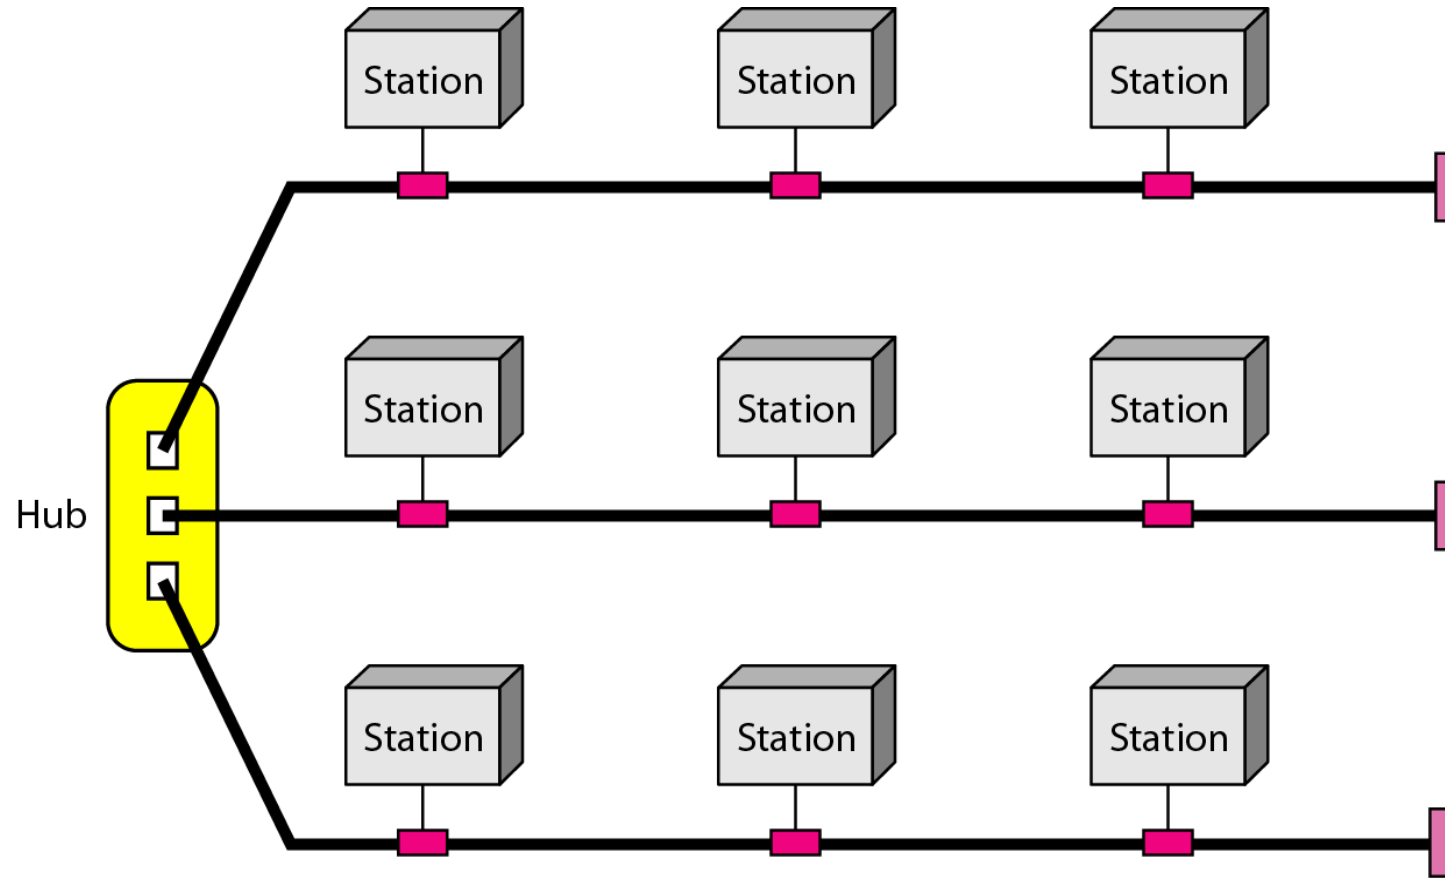

A **bus** topology connecting three stations

A ring topology connecting six stations

A **hybrid** topology: a star backbone with three bus networks

Kategori Jaringan

Local Area Networks (LANs)

Short distances

Designed to provide local interconnectivity

Wide Area Networks (WANs)

Long distances

Provide connectivity over large areas

Metropolitan Area Networks (MANs)

Provide connectivity over areas such as a city, a campus

An isolated **LAN** connecting 12 computers to a hub in a closet

WANs: a switched WAN and a point-to-point WAN

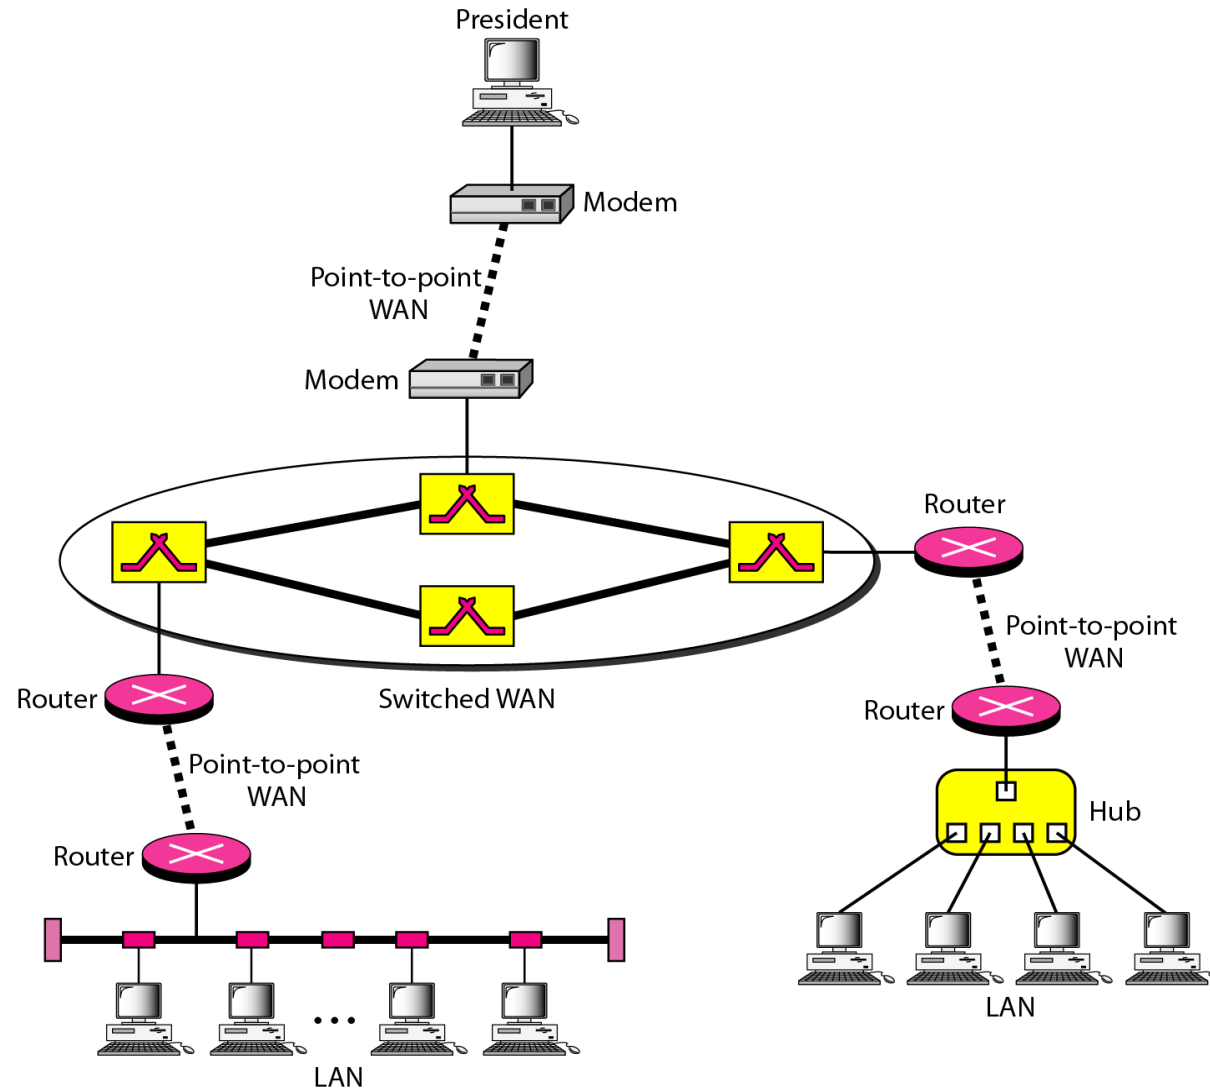

a. Switched WAN

b. Point-to-point WAN

A heterogeneous network made of four WANs and two LANs

Internet

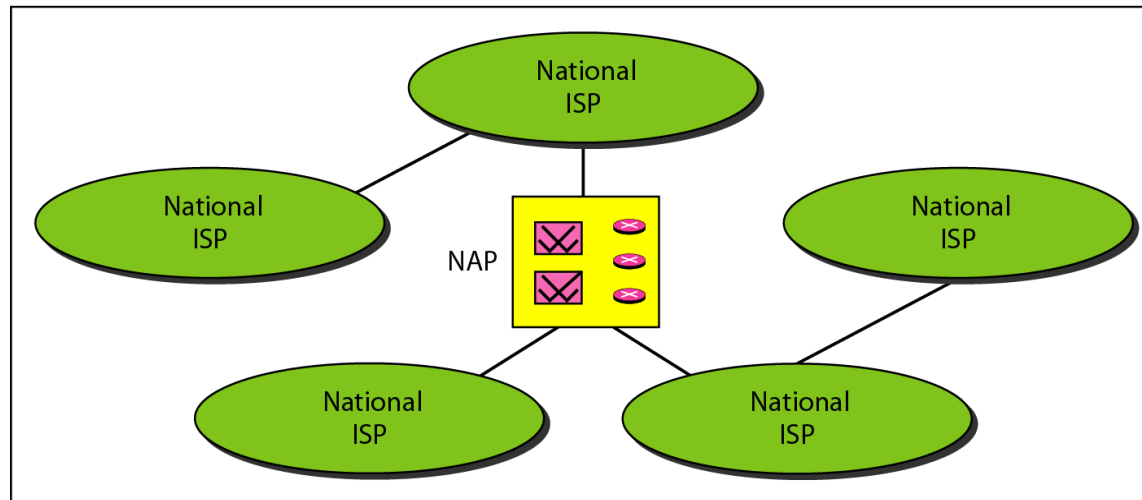

Internet telah merevolusi banyak aspek kehidupan kita sehari-hari, mempengaruhi cara kita melakukan bisnis serta cara kita menghabiskan waktu luang. Internet adalah sistem komunikasi yang telah membawa banyak informasi ke ujung jari kita dan mengaturnya untuk kita gunakan.

Hierarchical organization of the Internet

a. Structure of a national ISP

b. Interconnection of national ISPs

Protokol

Protokol identik dengan aturan.
Protokol terdiri dari seperangkat aturan yang mengatur komunikasi data, yang menentukan apa yang dikomunikasikan, bagaimana dikomunikasikan dan kapan dikomunikasikan. Elemen-elemen kunci dari protokol adalah syntax, semantics, dan timing.

Elements of a Protocol

Syntax

Structure or format of the data

Indicates how to read the bits - field delineation

Semantics

Interprets the meaning of the bits

Knows which fields define what action

Timing

When data should be sent and what

Speed at which data should be sent or speed at which it is being received.

Model Jaringan

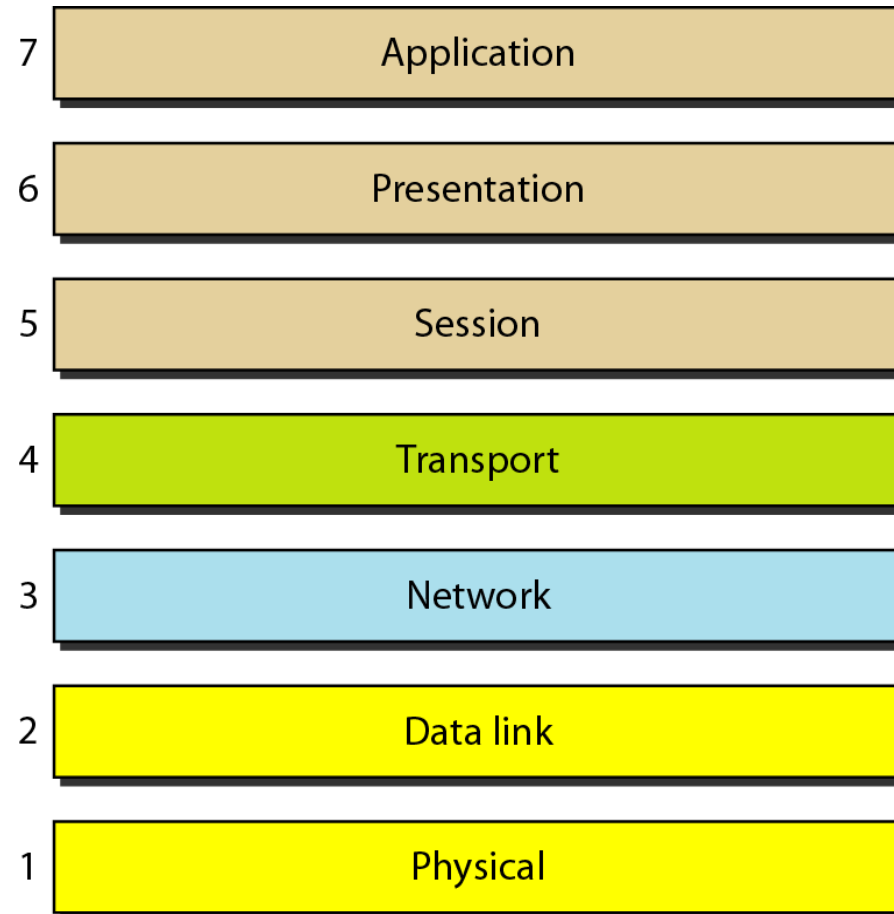

Model OSI

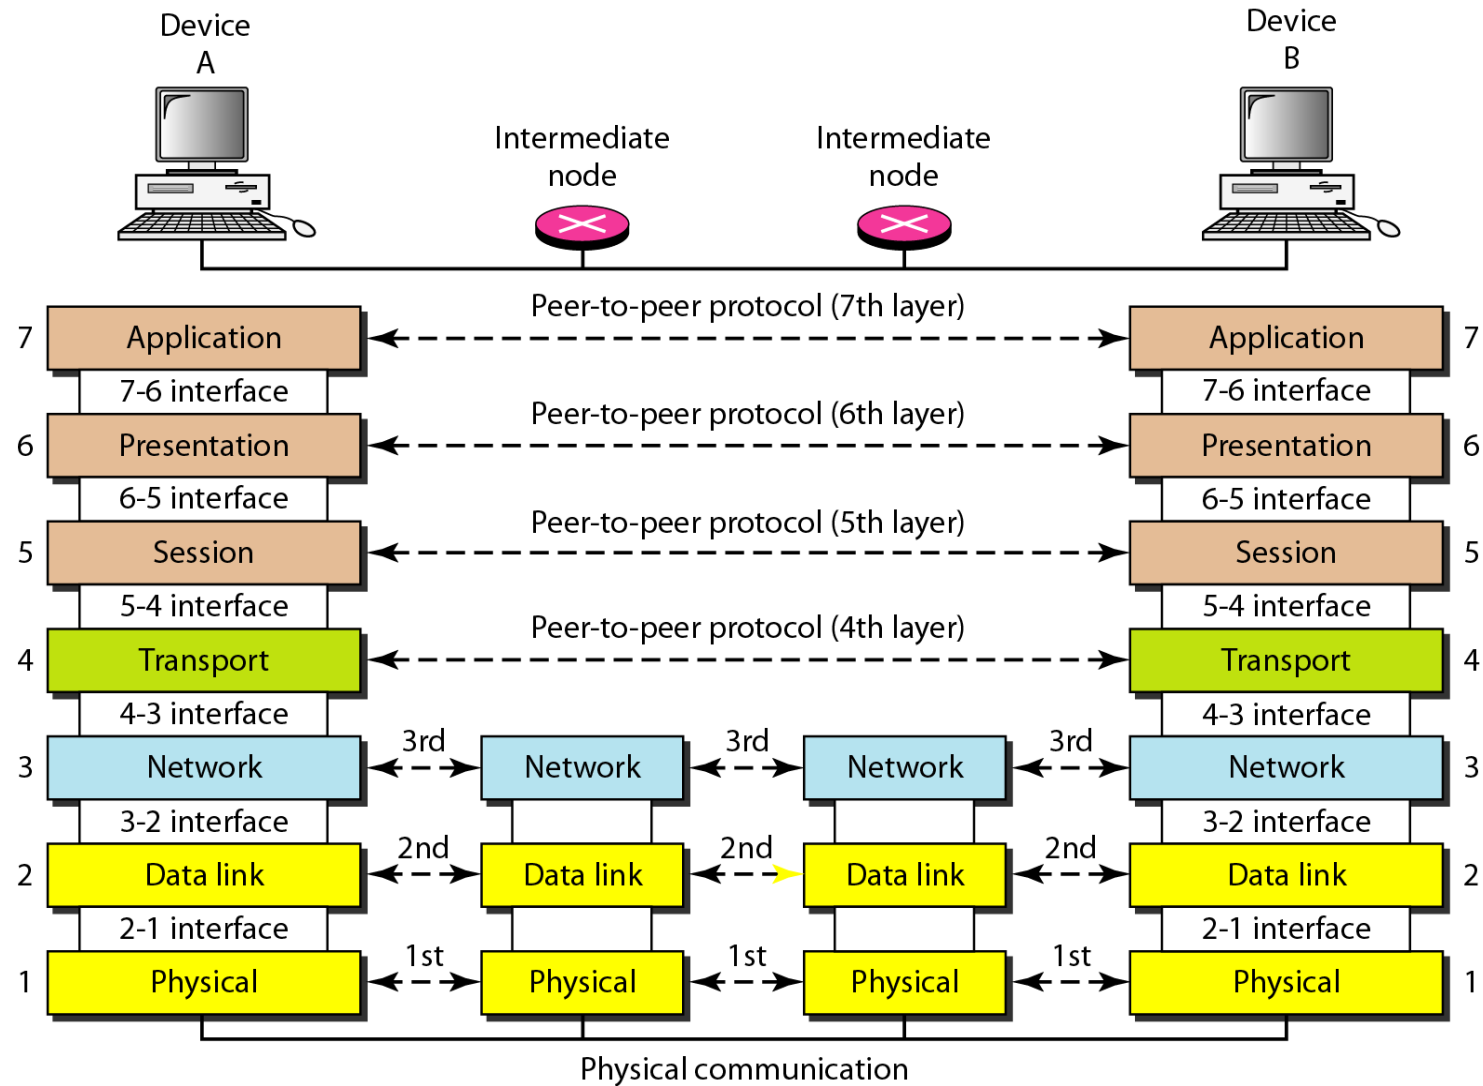

Didirikan pada tahun 1947, *International Standards Organization* (**ISO**) adalah badan multinasional yang didedikasikan untuk perjanjian seluruh dunia mengenai standar internasional. Standar ISO yang mencakup semua aspek komunikasi jaringan adalah model *Open Systems Interconnection* (**OSI**), pertama kali diperkenalkan pada akhir 1970-an.

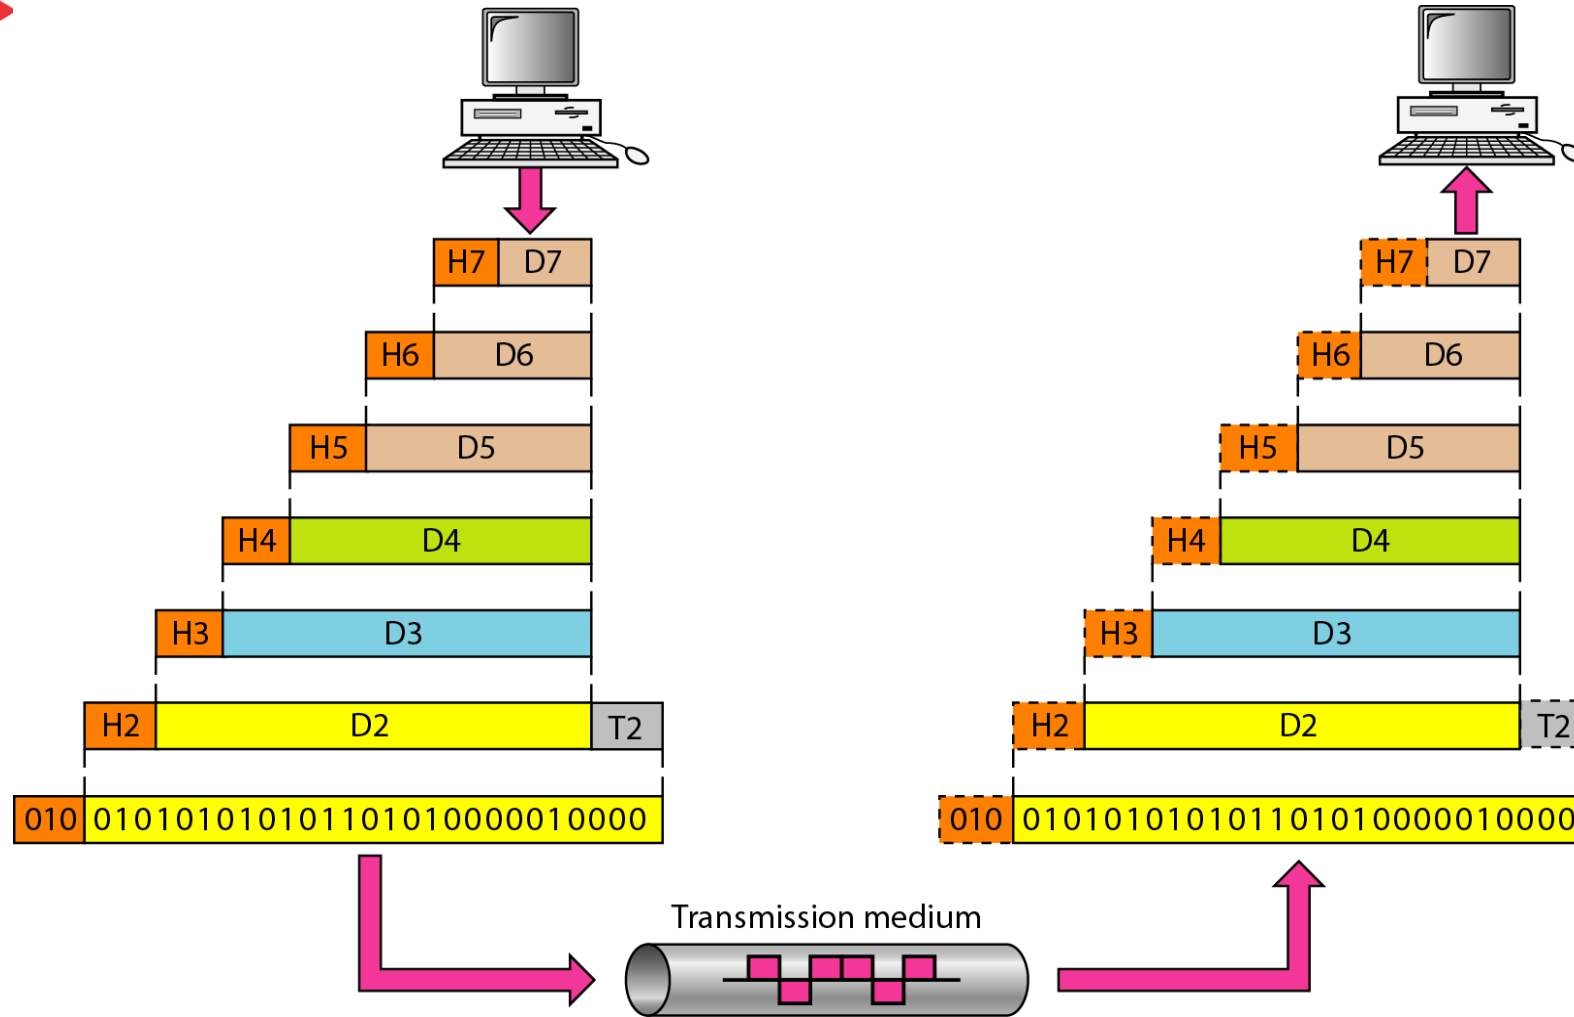

Tujuh layer model OSI

Interaksi antara layer pada model OSI

Pertukaran menggunakan model OSI

1 - Physical layer

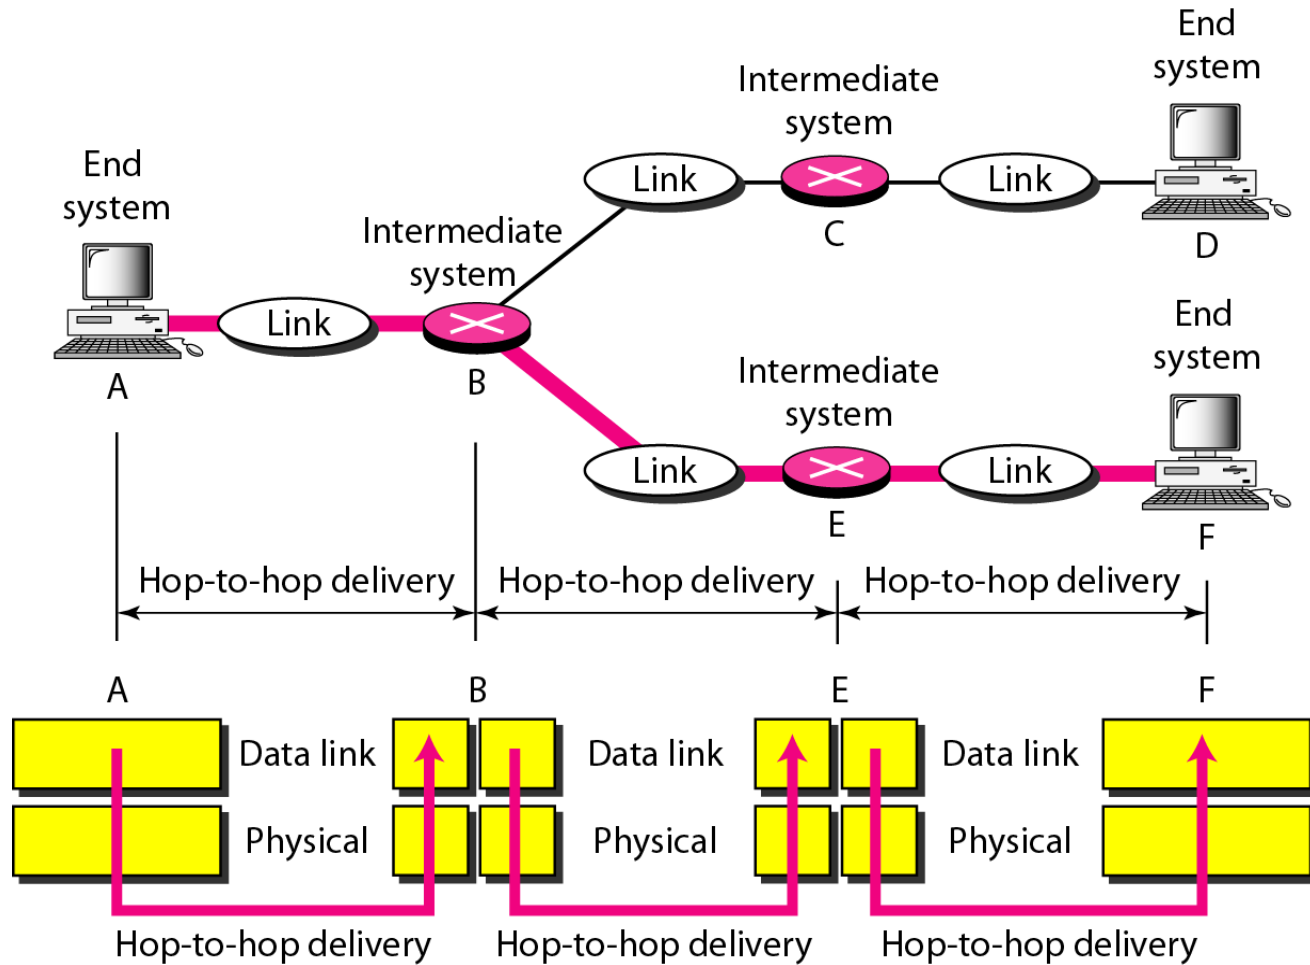

The physical layer is responsible for movements of individual bits from one hop (node) to the next.

2 - Data link layer

The data link layer is responsible for moving frames from one hop (node) to the next.

Hop-to-hop delivery

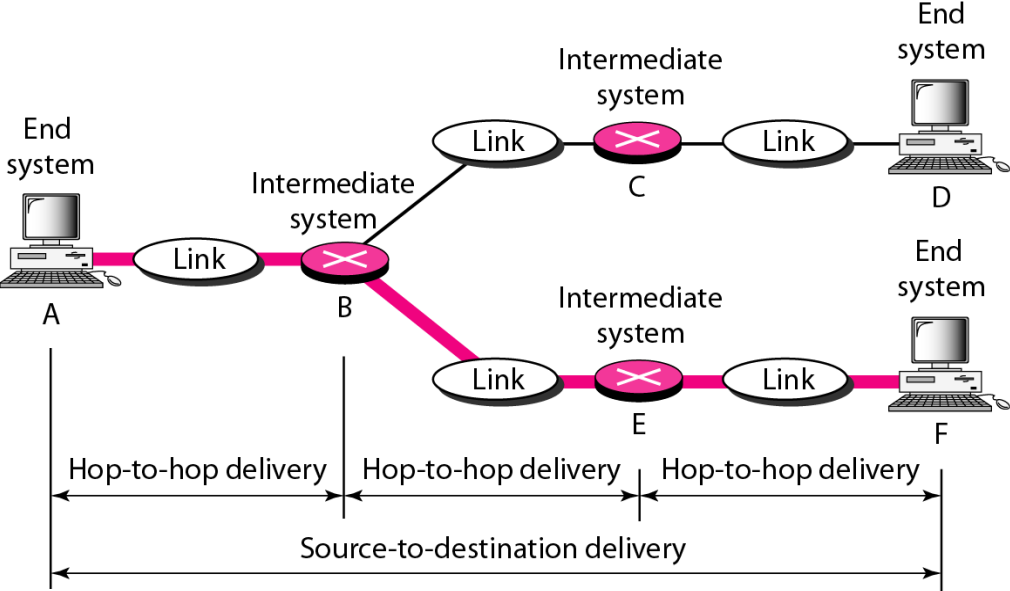

3 - Network layer

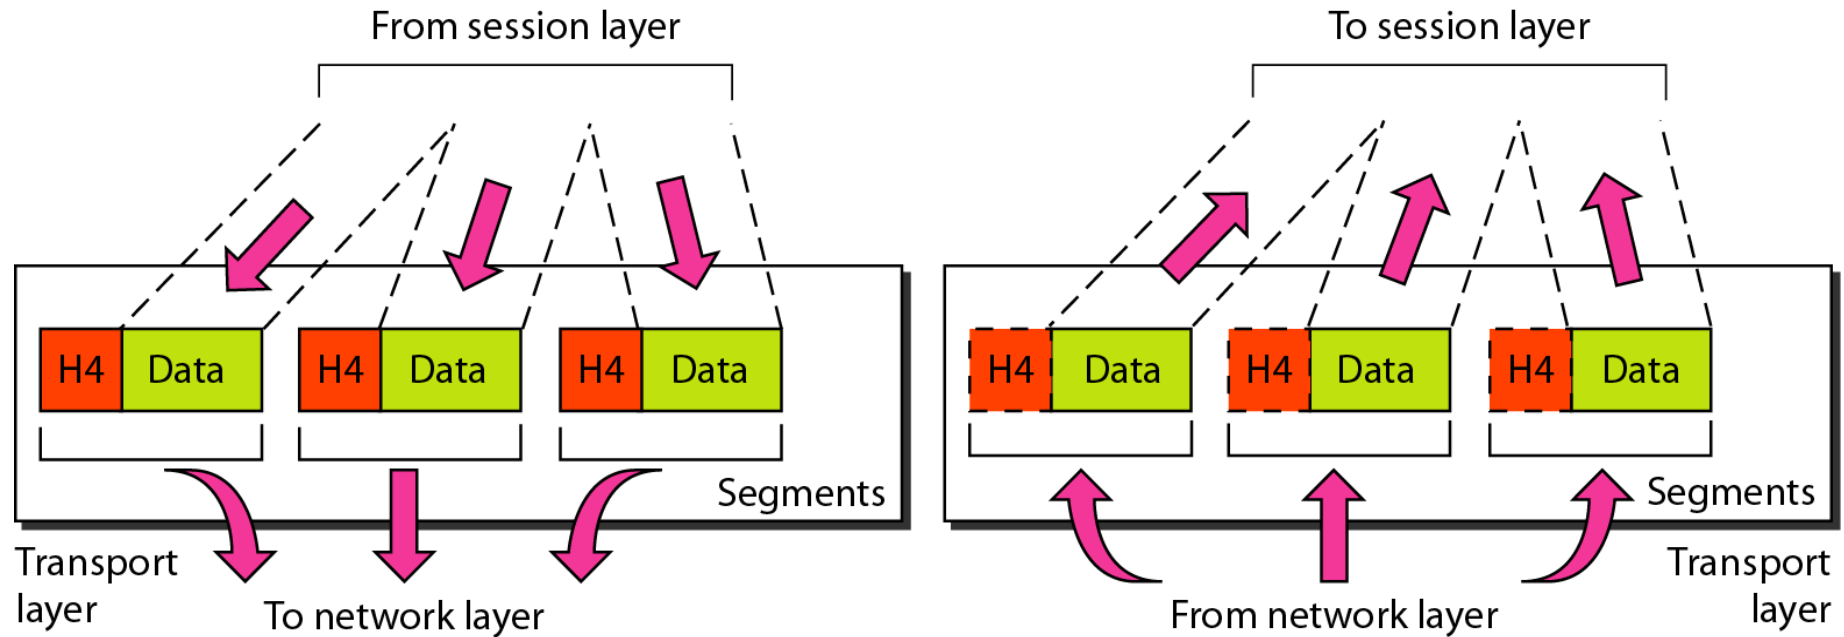

The network layer is responsible for the delivery of individual packets from the source host to the destination host.

Source-to-destination delivery

4 - Transport layer

The transport layer is responsible for the delivery of a message from one process to another.

Reliable process-to-process delivery of a message

5 - Session layer

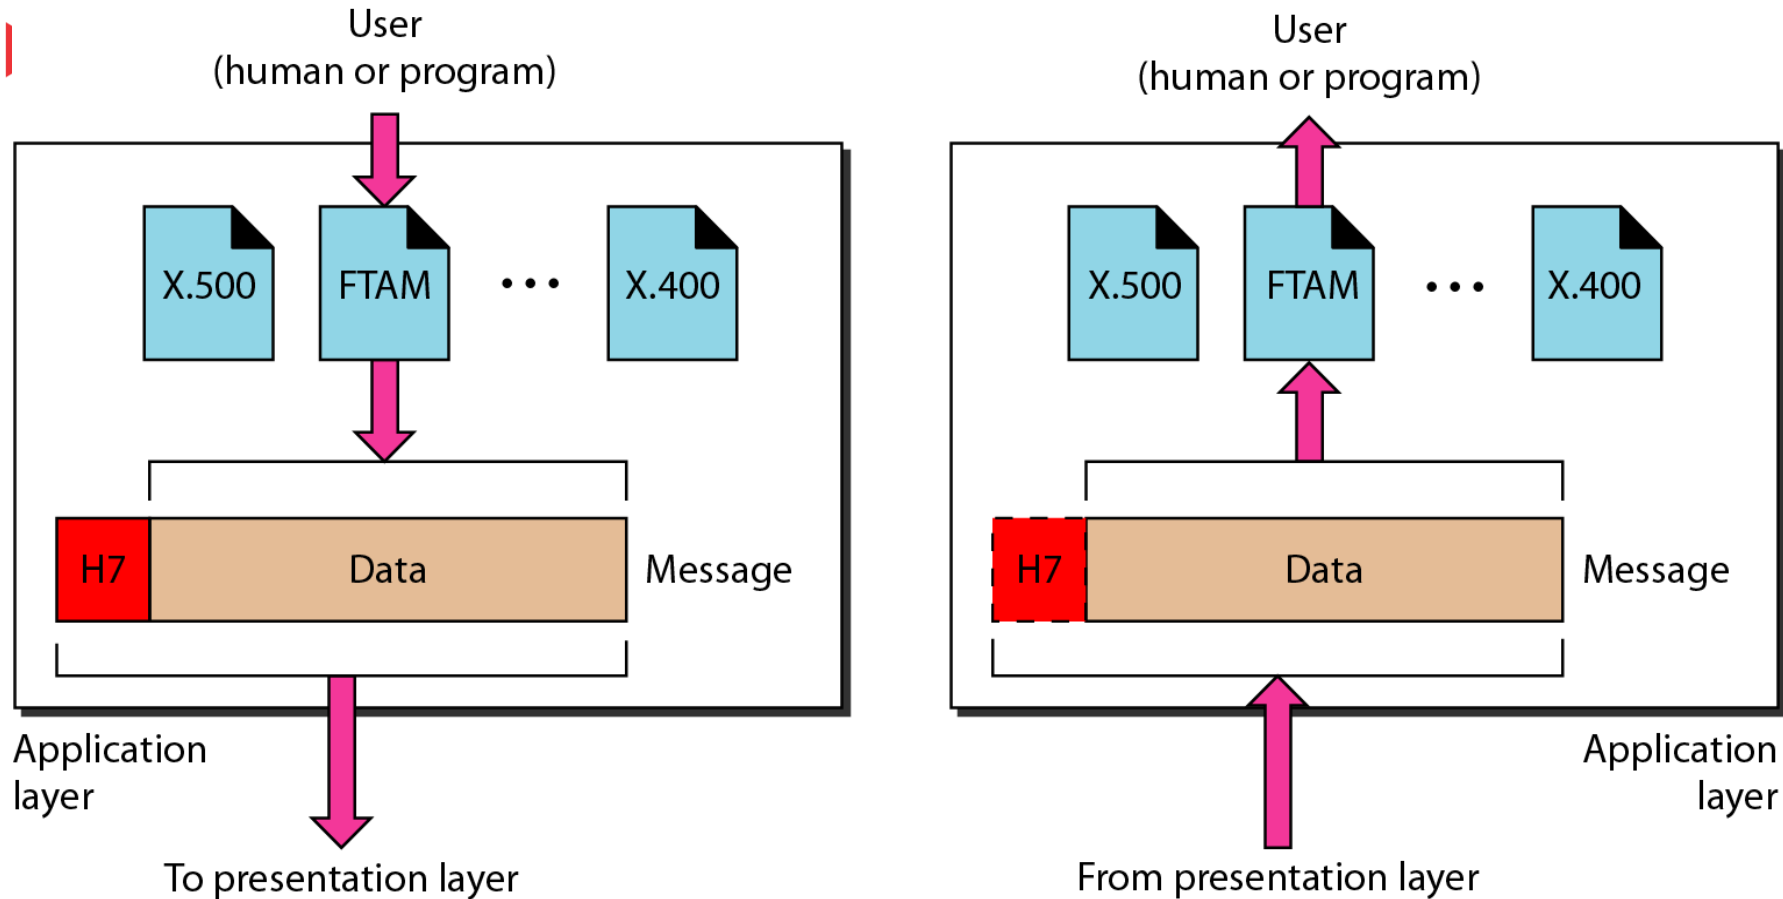

The session layer is responsible for dialog control and synchronization.

6 - Presentation layer

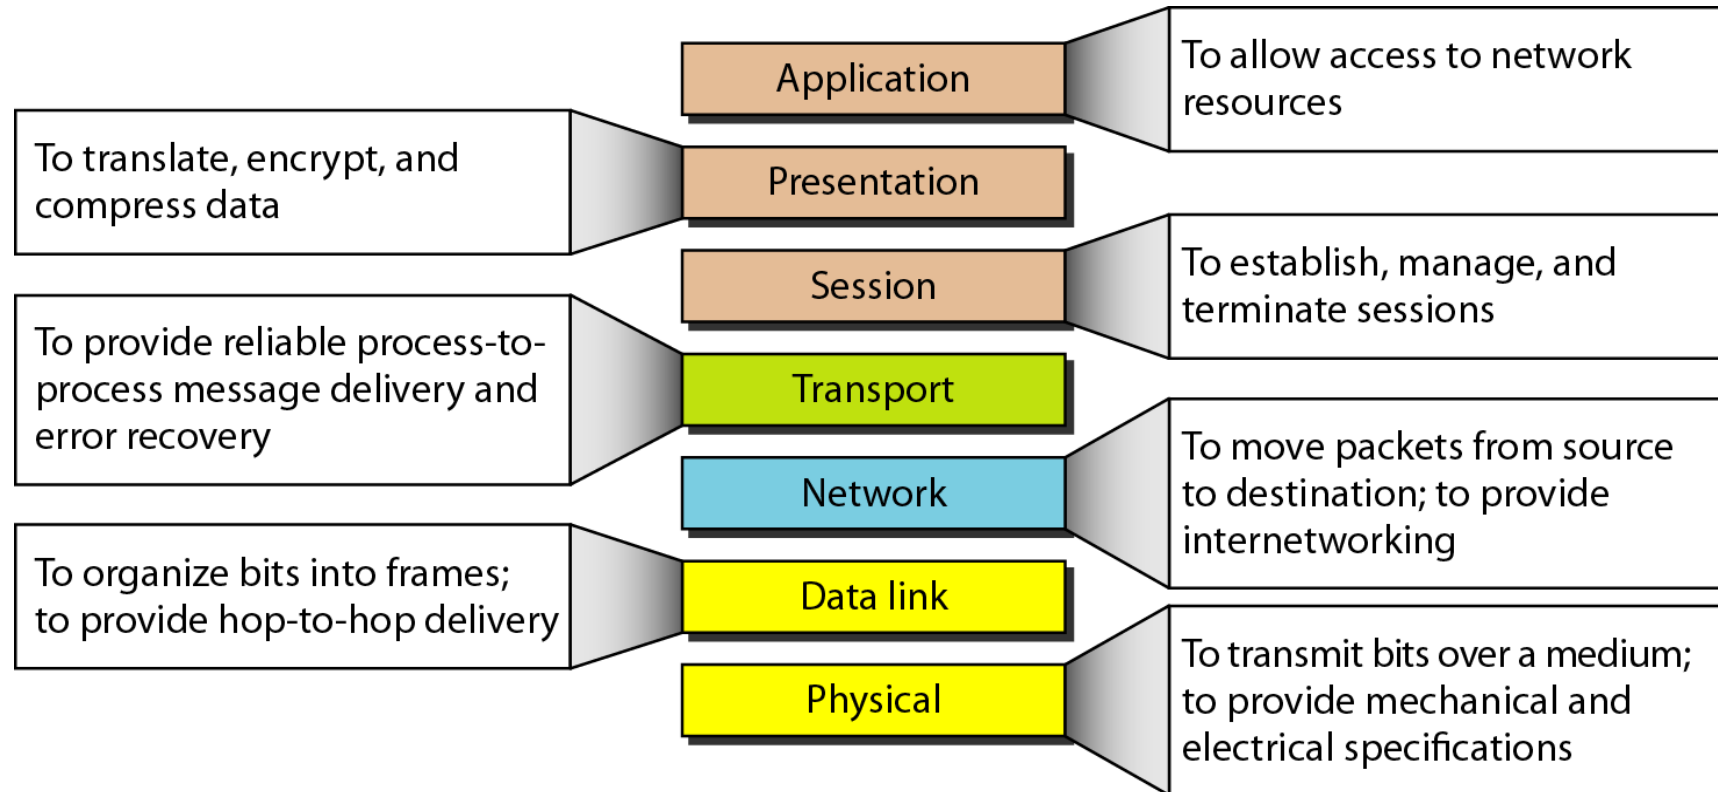

The presentation layer is responsible for translation, compression, and encryption.

7 - Application layer

The application layer is responsible for providing services to the user.

Summary of layers

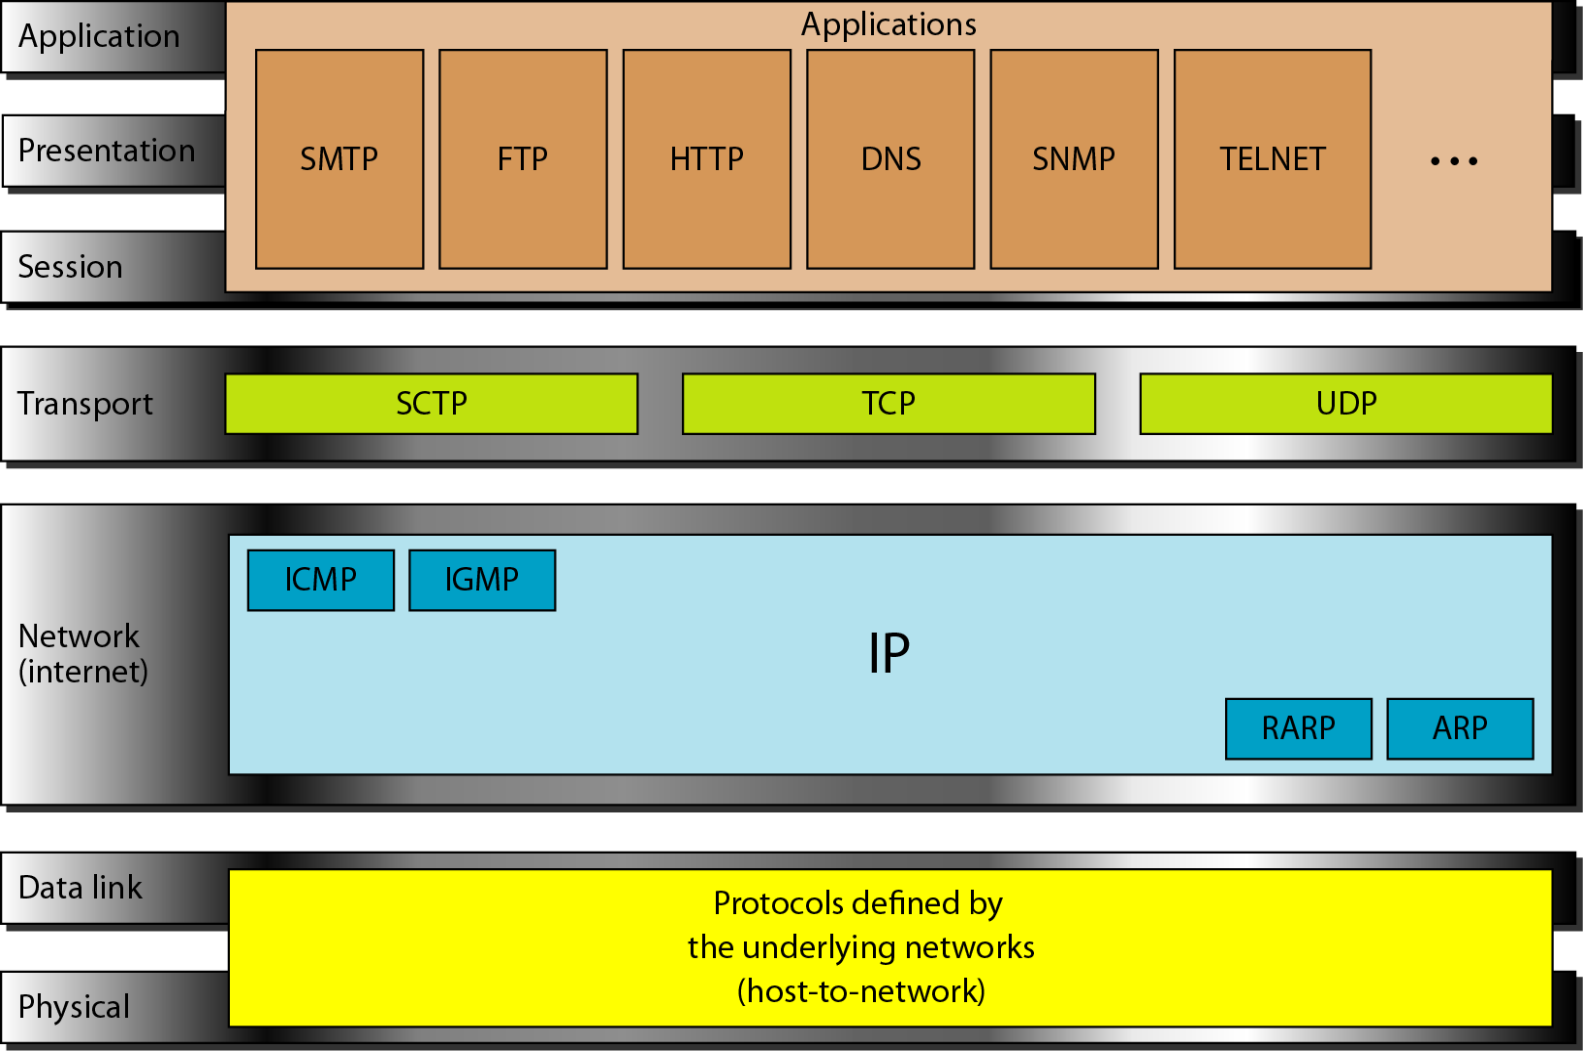

TCP/IP Protocol Suite

Layer pada **TCP/IP protocol suite** tidak sama persis dengan layer pada model OSI. Pada dasarnya, TCP/IP memiliki empat layer: **host-to-network**, **internet**, **transport**, dan **application**. Namun, saat dibandingkan dengan OSI, dapat dikatakan bahwa TCP/IP memiliki lima layer: **physical**, **data link**, **network**, **transport**, dan **application**.

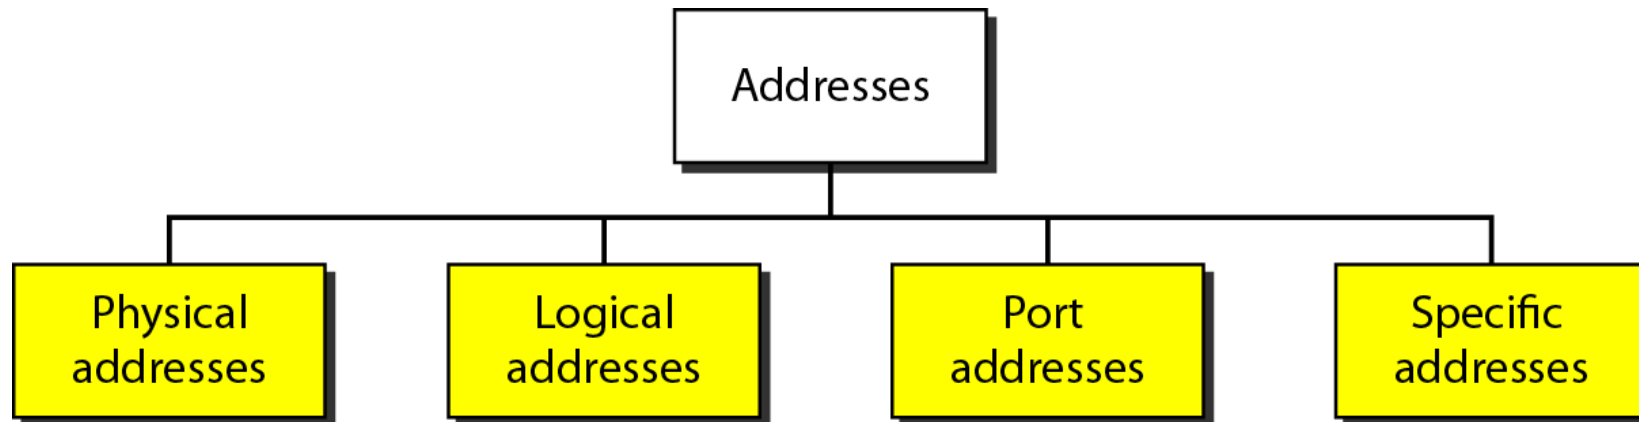

TCP/IP and OSI model

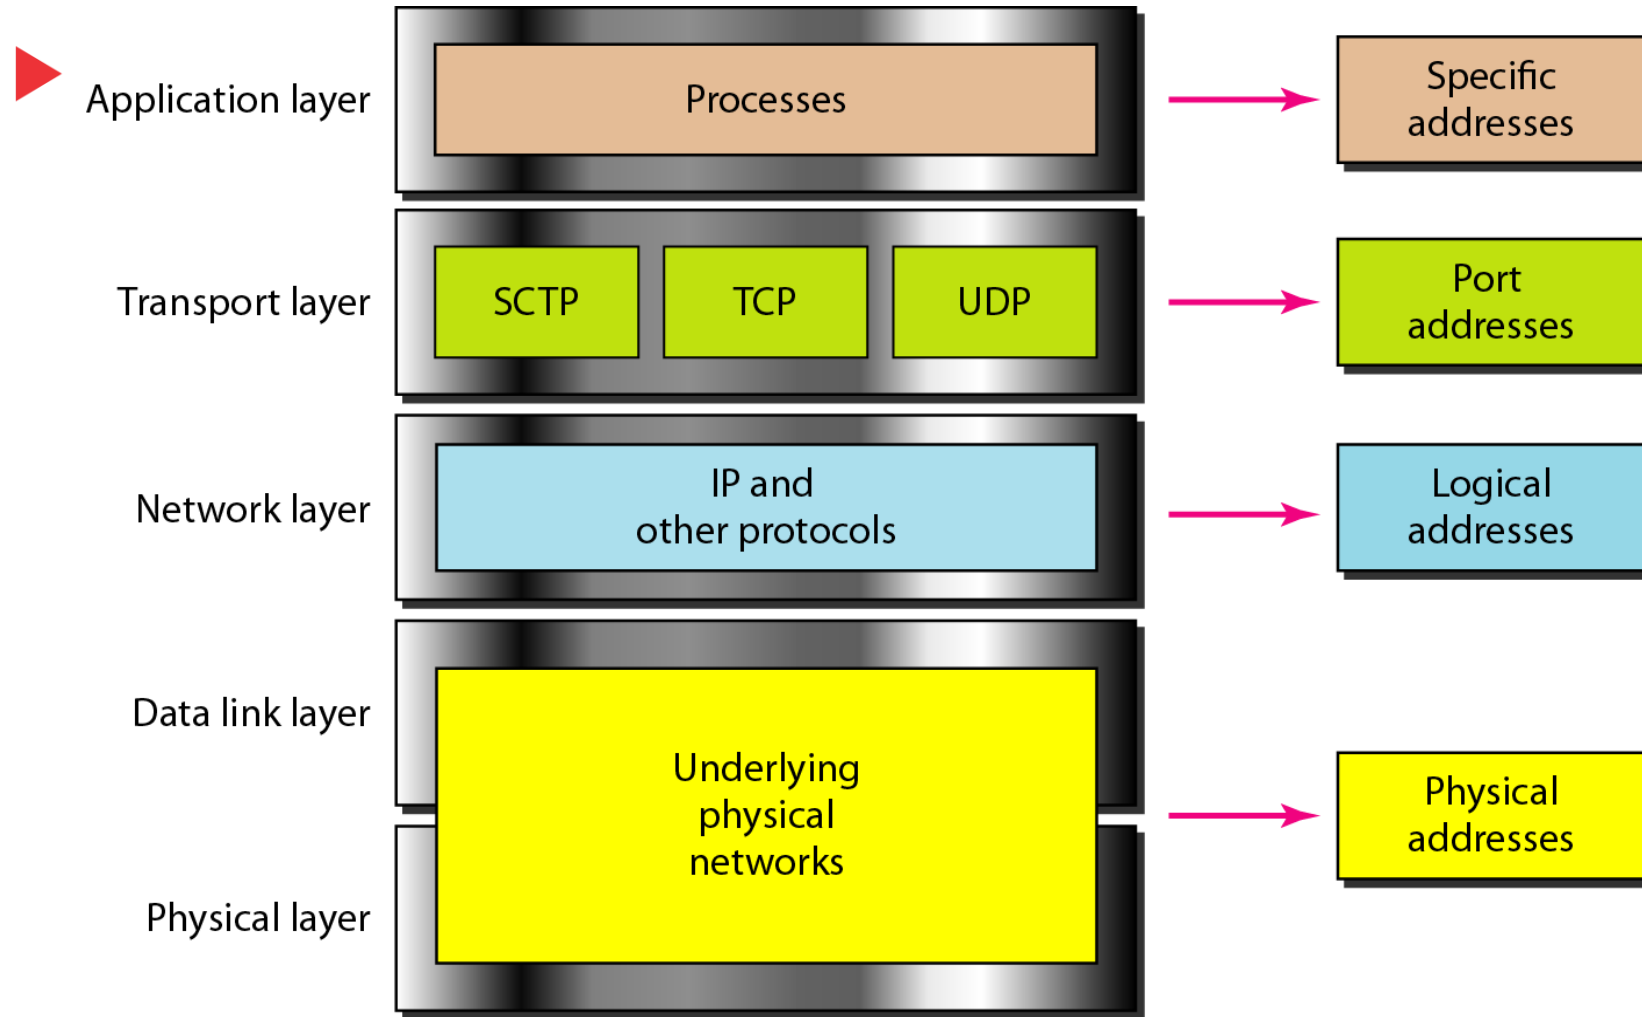

Addressing

Four levels of addresses are used in an internet employing the TCP/IP protocols: **physical**, **logical**, **port**, and **specific**.

Relationship of layers and addresses in TCP/IP
